

IN THE ABSTRACT

Please delete prior abstract and insert the following:

A laminating apparatus includes a conveyor for conveying a laminating object, a dryer for drying the laminating object conveyed by the conveyor, and a laminate device for effecting laminate processing on the laminating object dried by the dryer. A controller controls a temperature of the dryer so that the temperature of the dryer is adjusted to a predetermined temperature T1 before the laminating object arrives at the dryer, and so that the temperature of the dryer is adjusted to a predetermined temperature T2 greater than the temperature T1 when the laminating object is being dried by the dryer.
